# ALIGN/ALGN2 Parameter TRACKv39

n **ALIGN** name  $\delta_{xy}$   $\delta_z$   $\phi_z$   $\delta\phi_{dyn.}$   $\delta F_{dyn.}$   $\delta\phi_{static}$   $\delta F_{static}$

n **ALGN2** name  $\delta_x$   $\delta_y$   $\delta_z$   $\phi_x$   $\phi_y$   $\phi_z$   $\delta\phi_{dyn.}$   $\delta F_{dyn.}$   $\delta\phi_{static}$   $\delta F_{static}$

- ▶  $\delta_{xy}[cm]$  From the max allowed displacement of element ends, the maximum allowed rotation is calculated. Then the random errors are generated for both displacement and rotation. The generated errors are accepted only if the final displacements of the element ends is within the tolerance (max allowed displacement) specified as input. Uniform distribution.
- ▶  $\delta_x[cm]$  Displacement parallel to the x-axis. Uniform distribution.
- ▶  $\phi_x[mrad]$  Rotation of the element with respect to the center of the element. Uniform distribution
- ▶  $\delta\phi_{dyn.}[deg]$  : Amplitude of the dynamic phase error of the device. Gaussian distribution truncated at 3 sigma.
- ▶  $\delta F_{dyn.}[\%]$  : Amplitude of the dynamic field error of the device. Gaussian distribution truncated at 3 sigma.
- ▶  $\delta\phi_{static}[deg]$  : Amplitude of the static phase error of the device. Uniform distribution.
- ▶  $\delta F_{static}[\%]$  : Amplitude of the static field error of the device.

# Error Simulation (24000 runs)

- ▶ From RFQ exit to end of the CW 3 GeV linac ( $\sim 420$  meters)
- ▶ 60 errors simulated with TRACKv39
- ▶ Each error simulated with 400 seeds with 3D SC (10 mA) and 50k per seed
- ▶  $60 \times 400 = 24000$  runs with TRACKv39 on FermiGrid
